Us

# The Road to Darwinian Evolution

Aristotle (384-322 B.C.)  
Spontaneous generation

John Ray (1627-1705 A.D.)  
Categorization of genera and species – inference that similar organisms are connected in some fashion

Carl Linnaeus (1707-1778 A.D.)  
Generation of new life by creating hybrids – implied inheritance

Jean-Baptiste Lamarck (1744 – 1829 A.D.)  
Suggested that species evolve. Modifications made over one lifetime are passed to descendants

Gregor Mendel (1822 – 1884 A.D.)  
Inheritance and inheritance pattern of traits -> genes

Louis Pasteur (1822 – 1895 A.D.)  
Finally disproved spontaneous generation of life

# Spontaneous Generation

Aristotle -

Animated life comes from inanimate things

Moldy Grain

Rocks & Mud

Rotten Meat

Fire

# The Road to Darwinian Evolution

Aristotle (384-322 B.C.)  
Spontaneous generation

John Ray (1627-1705 A.D.)  
Categorization of genera and species – inference that similar organisms are connected in some fashion

Carl Linnaeus (1707-1778 A.D.)  
Generation of new life by creating hybrids – implied inheritance

Jean-Baptiste Lamarck (1744 – 1829 A.D.)  
Suggested that species evolve. Modifications made over one lifetime are passed to descendants

Gregor Mendel (1822 – 1884 A.D.)  
Inheritance and inheritance pattern of traits -> genes

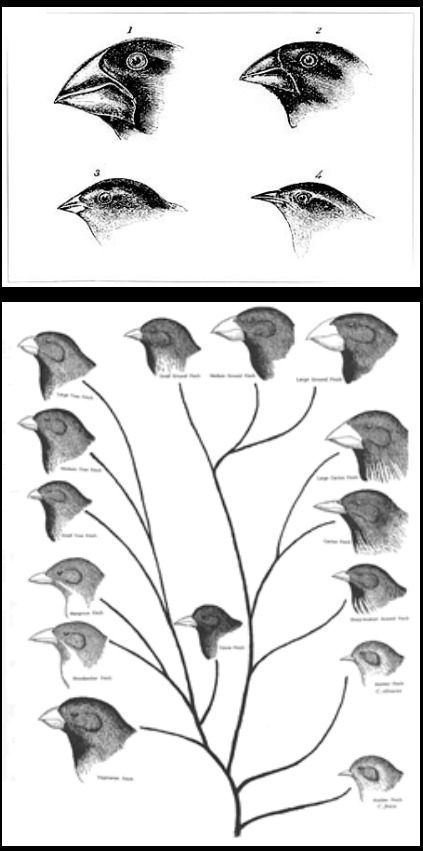

Louis Pasteur (1822 – 1895 A.D.)  
Finally disproved spontaneous generation of life

Common ancestor

# Evolution of species driven by natural selection

# Evolution

The change in inherited traits of a population of organisms over successive generations

Mutation – Genetic diversity – Inheritance – Natural Selection

# Mutation

## Modification of the genetic code

Silent – not transcribed or wobble region

Expressed – leads to a change in protein function and thus physical trait

# Mutation

5' NASA is hiding aliens on this base. 3'

NASA is **h**ying aliens on this base.  
*Silent point mutation*

NASA **a**s hiding aliens on this base.  
*Deleterious point mutation*

NASA **i**p shidin galien so nthi sbase.  
*Deleterious point mutation with a frame shift*

NASA is hiding **olives** on this base.  
*Multiple mutations leading to new function*

# Mutation

Most mutations are deleterious  
Loss of function  
Death

## Rates of Mutation

Humans:

$2.5 \times 10^{-8}$  mutations/nucleotide/generation

175 mutations per generation

3 million base pairs in human genome

Mutation rates can increase when organisms  
are stressed

Accumulation of slightly deleterious mutations  
Purged through sexual reproduction

# Mutation

Most mutations are deleterious  
Loss of function  
Death

## Rates of Mutation

Humans:

$2.5 \times 10^{-8}$  mutations/nucleotide/generation

175 mutations per generation

3 million base pairs in human genome

Mutation rates can increase when organisms  
are stressed

Accumulation of slightly deleterious mutations  
Purged through sexual reproduction

UV radiation

X-rays

Gamma rays

Ethidium Bromide

Air bags (Sodium azide)

Plastic (Benzene)

Viruses

Transcription errors

Hot Dogs (Nitrates)

Cooked food (heterocyclic amines)

Nalgene water bottles (bisphenol-A)

Smog

Cigarettes (benzo[a] pyrene)

Sun

Air

Food

People

# Gene Duplication

Major role in evolution

Greater gene expression – sometimes good, sometimes bad

Neutral – gene can accumulate mutations leading to a new function

- 1) Digestive enzyme in ice fish
- 2) Myoglobin and Haemoglobin

## Genome duplication

Two (or more) copies of the same gene but on separate chromosomes

Increases diversity

Limits the effects of deleterious mutations – masked by gene copy

Polyploidy:

Triploids – Banana

Tetraploids – Tobacco

Hexaploid – Kiwi fruit

Octaploid - Strawberry

# Selection

Evolutionary pressure that works over multiple generations to cause certain traits to become more prominent than others in a population

# Selection

- Environmental Selection – Physical pressures from the environment (temperature, predation, water availability)
- Sexual Selection – mate selection
- Artificial Selection – Human interests

# Environmental Selection

## Environmental Stress

Temperature  
Food availability  
Water availability  
Sun availability

## Predation or Grazing

Any environmental factor that prevents you  
from procreating

# Global Climate Change

Rates of environmental change  
vs.  
Rates of evolution

Evolution:  
Generation time  
Genetic diversity  
Expressed diversity (population size, clutch size)

Acclimation:  
Dispersion  
Mobility

# Sexual Selection

# Sexual Selection

# Sexual Selection

Physical modifications  
to attract mates

Physical modifications  
to compete for mates

Behavioral modifications  
to attract mates

**INCREASE VISIBILITY TO PREDATORS**

# Selective Breeding

Natural selection is circumvented through human intervention

1. Humans breed organisms with traits beneficial to our needs
2. Humans prevent organisms of the same species with non-ideal traits from breeding
3. Modify environment to sustain new organism
  - remove predation, competition, provide resources
4. Called “Domestication”

# Selective Breeding

## Corn

## Dogs

# Selective Breeding

Kohlrabi

Cauliflower

Cabbage

Broccoli

Kale

Brussel  
Sprouts

Chinese  
Broccoli

*Brassica oleracea*

# Genetic Modification

Transfer genes between organisms that can not be breed through conventional means

Gene addition or gene deletion

EnviroPig

GFP Mice

Square Tomato

# Creating New Life from Scratch

Create designer genomes and thus designer life to perform specific tasks

**May 2010**

Artificially generated a bacterial genome and integrated it into a bacterial host cell

Questions:

Is this different than selective breeding?

Is it moral to patent life?

What are the implications?

# Future of life

As we move into space and to other planet we will take life with us.

How will life evolve in these new environments?

Low or no gravity

Cosmic radiation

How will human pathogens evolve?
